Mertens B., Muriuki C.;

Submitted (JAN-197) to the EMBL/GenBank/DDBJ databases.

-1- CATALYTIC ACTIVITY: D-GLYCERALDEHYDB 3-PHOSPHATE + ORT

+ NAD(+) = 1,3-DIPHOSPHATEGLYCERATE + NADH.

-1- PATHMAY: EIRST STEP IN THE SECOND PHASE OF GLYCOLYSIS.

-1- SUBUNIT: HOMOTETRAMER.

-1- SUBCELLULAR LOCATION: CYTOPLASMIC.

-1- SIMILARITY: BELONGS TO THE GLYCERALDEHYDE 3-PHOSPHATE

database of human heart.";

CATALYTIC ACTIVITY: D-GLYCERALDEHYDE 3-PHOSPHATE + ORTHOPHOSPHATE

-!- CATALYTIC ACTIVITY: D-GLYCERATE + NADH.

-!- PATHWAY: FIRST STEP IN THE SECOND PHASE OF GLYCOLYSIS.

-!- SUBLULIAR LOCATION: CYTOPLASMIC.

-!- SUBCELLULAR LOCATION: OTHE GLYCERALDEHYDE 3-PHOSPHATE

-!- SUBCELLULAR LOCATION: OTHE GLYCERALDEHYDE 3-PHOSPHATE

-!- SIMILARITY: BELONGS TO THE GLYCERALDEHYDE 3-PHOSPHATE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     use by modified

The present invention describes lung tumour specific polynucleotides and tumour antigens. 207144 to 207246 and 208301 to 208325 represent specifically claimed polynucleotides, and Y29486 to Y29571 represent amino acid sequences from the present invention. The lung tumour

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of the N-terminal region of foetal human brain zonulin. The N-terminal sequences of human adult an foetal zonulins (see Y79130-36) were compared with Vibrio choler zonula occludens toxin (ZOT) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-b

                                                                                                                                                                    The present sequence is given in a specification relating to compounds for therapy and diagnosis of lung cancer. Polypeptides comprising at least an immunogenic part of a lung tumour protein are disclosed. The polypeptides are useful for inhibiting the development of cancer, especially lung cancer. Samples of T cells expressing the polypeptides may be used to inhibit the development of cancer. The polypeptides are also useful for detecting and monitoring the progression of cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      B44446 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    specific polynucleotides and polypeptides can be used in pharmaceutical compositions and vaccines to inhibit the development of lung cancer. They can also be used to detect lung cancer in a patient. Probes and antibodies derived from the lung tumour sequences are useful in detection of lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                      The present invention describes lung tumour specific polynucleotides and tumour antigens. 207144 to 207246 and 208301 to 208325 represent specifically claimed polynucleotides, and v29486 to v29571 represent amino acid sequences from the present invention. The lung tumour specific polynucleotides and polypeptides can be used in pharmaceutic compositions and vaccines to inhibit the development of lung cancer. They can also be used to detect lung cancer in a patient. Probes and antibodies derived from the lung tumour sequences are useful in detection of lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lung tumour specific polynucleotides of lung cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is given in a specification relating to compounds for therapy and diagnosis of lung cancer. Polypeptides comprising at least an immunogenic part of a lung tumour protein are disclosed. The polypeptides are useful for inhibiting the development of cancer, especially lung cancer. Samples of T cells expressing the polypeptides may be used to inhibit the development of cancer. The polypeptides are also useful for detecting and monitoring the progression of cancer,

The method comprises: (a) contacting a binds to the NAM an expression product or a fragment of an expression product complexed with an expression product or a fragment of an expression interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast lung rancer. Colon cancer, gastric cancer, prostate cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence is encoded by a human gene of the invention, and is induced to express by both HCMV and interferon (IFN), designated HCMV-inducible genes (cig or cigs). The invention also relates to genes that are repressed in the presence of HCMV infection, designated HCMV-repressible genes (crg or crgs). The products can be used to obtain agents which can be used for anti-viral therapy, particularly anti-HCMV therapy. They can also be used for the development of drugs that would allow for higher dosage IFN treatments without the concomitant toxicity normally associated with administering high levels of IFN. The products can also be used for detection, diagnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   18-OCT-2000

                                                                                                                                                                                                                   The present sequence represents glyceraldehyde 3 phosphate dehydrogenase (GPD) isolated from Lentinus edodes (Lentinula edodes; Camonly known as the shittake mushroom). The present invention describes the promoter and terminator regions from the promoter and terminator regions.
                                                                                                                                                                                                                                                                Disclosure; Page 14-15; 20pp; Japanese.

The present sequence represents a ubiquitin-ribosomal 40S protein derived from Phaffla, which is mentioned in the disclosure of the present invention describing novel recombinant DNA. The recombinant DNA comprises a transcription promoter operably linked to a downstream sequence to be expressed, where the transcription promoter comprises a region found upstream of the open reading frame (ORF) of a highly expressed Phaffla gene (preferably GAPDH, a ribosomal protein gene, an enzyme involved in the biosynthesis pathway). The recombinant DNA can be used to transform hosts, preferably Phaffla. These transformed hosts are then used in the recombinant production of GAPDH or an enzyme involved in carotenoid synthesis, preferably astaxanthin. They may also be used to produce a pharmaceutical product. Purified carotenoids can be used as colourants in food and/or feed, and also in cosmetics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc human prostate prostate adenocarcinoma cell line LnCap.fgc (ATCC CRL 1740) with human prostatitis sera. Comparison of the peptide sequences with database sequences revealed homology to polypeptides not previously associated with human prostate. These were glyceraldehyde-3-phosphatate dehydrogenase (see W27316), calreticulin (see W27318 and W27319), malate dehydrogenase (see W27316), calreticulin (see W27318 and W27319), malate dehydrogenase (see W27313). Immunogenic portions of these peptides can be used in a claimed vaccine for treatment of prostate cancer, in a claimed vaccine for treatment of prostate cancer, in a claimed vaccine for treatment of prostate cancer, in for detecting prostate cancer or monitoring the progress of prostate cancer. 17 HPA polypeptides (see W27312-23 and W27303-07) and 14 other immunogenic polypeptides (see W27312-23 and W27303-07)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                Y02457;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the N-terminal sequence of glyceraldehyde-3-phosphate dehydrogenase (GAPDH). The invention relates to a new screening assay for compounds capable of inhibiting binding of GAPDH to polyglutamine. Compound, polyglutamine-containing an aqueous solution containing a test if binding of GAPDH to the polyglutamine-containing molecules and GAPDH and determining in the presence of the test compound. Inhibitors identified by the above assay could be used to treat neurodegenerative diseases or psychiatric disorders caused by a gene containing an extended CAG domain, e.g.
